

CLAIMS

1. A gas permeable substrate, comprising:
a porous metallic plate having a plurality of pores which form openings
in an upper surface and/or a lower surface thereof; and
5 particles filled in the pores,
wherein at least one of the upper surface and the lower surface of the
porous metallic plate is substantially smooth.
2. A gas permeable substrate according to claim 1,
10 wherein not less than 30% of the upper surface and/or the lower surface
of the porous metallic plate is covered with the particles.
3. A gas permeable substrate according to claim 1,
wherein the particles are constituted by any one of ceramics and a
15 composite material of ceramics and metal.
4. A gas permeable substrate according to claim 1,
wherein the particles includes a reforming catalyst and an electrode
material, and
20 a stacked structure having not less than two layers is formed within each
of the pores.
5. A gas permeable substrate according to claim 4,
wherein the electrode material forms at least a layer selected from a
25 group consisting of an air electrode layer, a fuel electrode layer, and an
intermediate layer.
6. A gas permeable substrate according to claim 1,
wherein the porous metallic plate is any one of a sintered metal body, an
30 etching board, and a punching board.

7. A gas permeable substrate according to claim 1,
wherein the porous metallic plate is a collector.
- 5 8. A gas permeable substrate according to claim 1,
wherein the porous metallic plate includes at least one type of metal
selected from a group consisting of stainless steal, Inconel, nickel, silver,
platinum, and copper.
- 10 9. A gas permeable substrate according to claim 1,
wherein a thickness of the porous metallic plate is within a range of 0.03
mm to 1 mm.
10. A solid oxide fuel cell, comprising:
- 15 a gas permeable substrate having a porous metallic plate which includes a
plurality of pores forming openings in an upper surface and/or a lower surface
thereof; and particles filled in the pores,
wherein at least one of the upper and lower surfaces of the porous
metallic plate are substantially smooth, and
- 20 single cells are stacked, each single cell including power generating
elements stacked on an upper surface and/or a lower surface of the gas permeable
substrate.
